

Almost Everyones Guide to Science

John Gribbin is one of the few science writers who is equally comfortable writing about biology as he is about physics, and this beginners guide will take the reader through the basics and the fundamental issues of the crucial areas of modern science, from the birth of the universe through to the evolution of our own species, the nature of human behaviour and the workings of our minds. Crucially, the book will not only provide an overview of the central areas in a single volume, but will also explain how the areas link up, what evolutionary theory has to say about how we think, how sub-atomic particles came into being in the Big Bang and atoms in stars.
