

Wetlands Engineering and River Restoration

This proceedings of almost 200 papers provides state-of-the-art information on the design of successful stream, riparian, and wetland restoration projects along with insightful approaches to watershed management. Numerous case studies detail successes and failures of various design approaches on both local and watershed scales. This collection provides a valuable resource for professional engineers and scientists struggling with design, implementation, and monitoring of restoration projects. The interdisciplinary background represented by the authors, and the practical information presented, makes this proceedings particularly useful to the practitioner. The topics include: River/Stream/Channel Restoration; Wetlands; Design; Watersheds; Hydraulics; and Unique Habitat Restoration Approaches.
